hadronic  
gas

- radius of Au nuclei:  $\sim 7\text{fm} = 7 \times 10^{-15}\text{m}$
- time to traverse the nucleus:  $7 \times 10^{-15}\text{m} / (3 \times 10^8\text{m/s}) = 20 \times 10^{-23}\text{s}$

# PHENIX & STAR

rare probes  
high event rates  
excellent  
calorimeter

large acceptance  
TPC for charged  
particle tracking  
and identification

detectors complementary

# PHENIX

- electrons, muons, photons, high rate

# hot QCD matter!

## Direct $\gamma$

# hot QCD matter!

# hot QCD matter!

# hot QCD matter!

**excess:**  
 $221 \pm 23 \pm 18 \text{ MeV}$

# hot QCD matter!

**excess:**

$221 \pm 23 \pm 18 \text{ MeV}$

consistent with initial  
 $T \sim 300\text{-}600 \text{ MeV}$

# hot QCD matter!

**excess:**

$221 \pm 23 \pm 18 \text{ MeV}$

consistent with initial  
 $T \sim 300\text{-}600 \text{ MeV}$

$T \sim \text{few trillion K}$

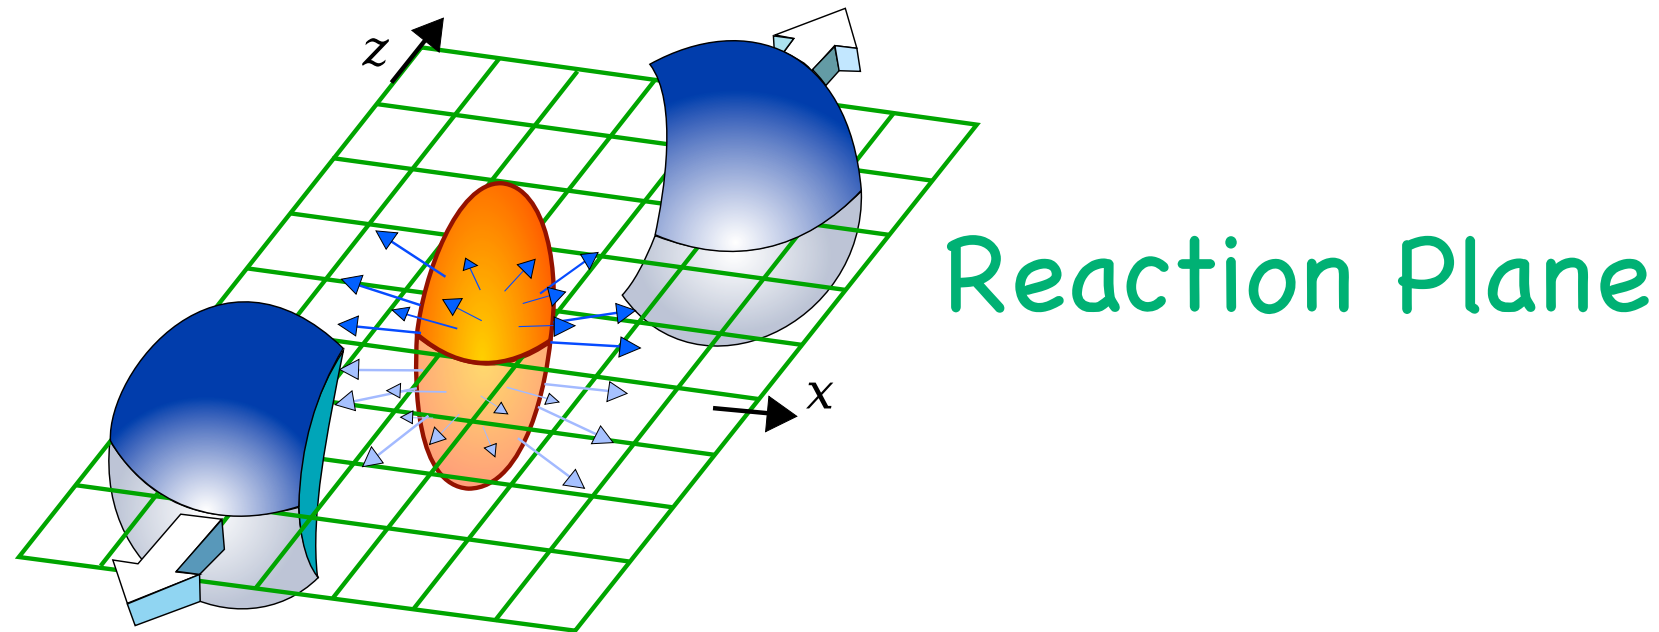

# Phases of QCD

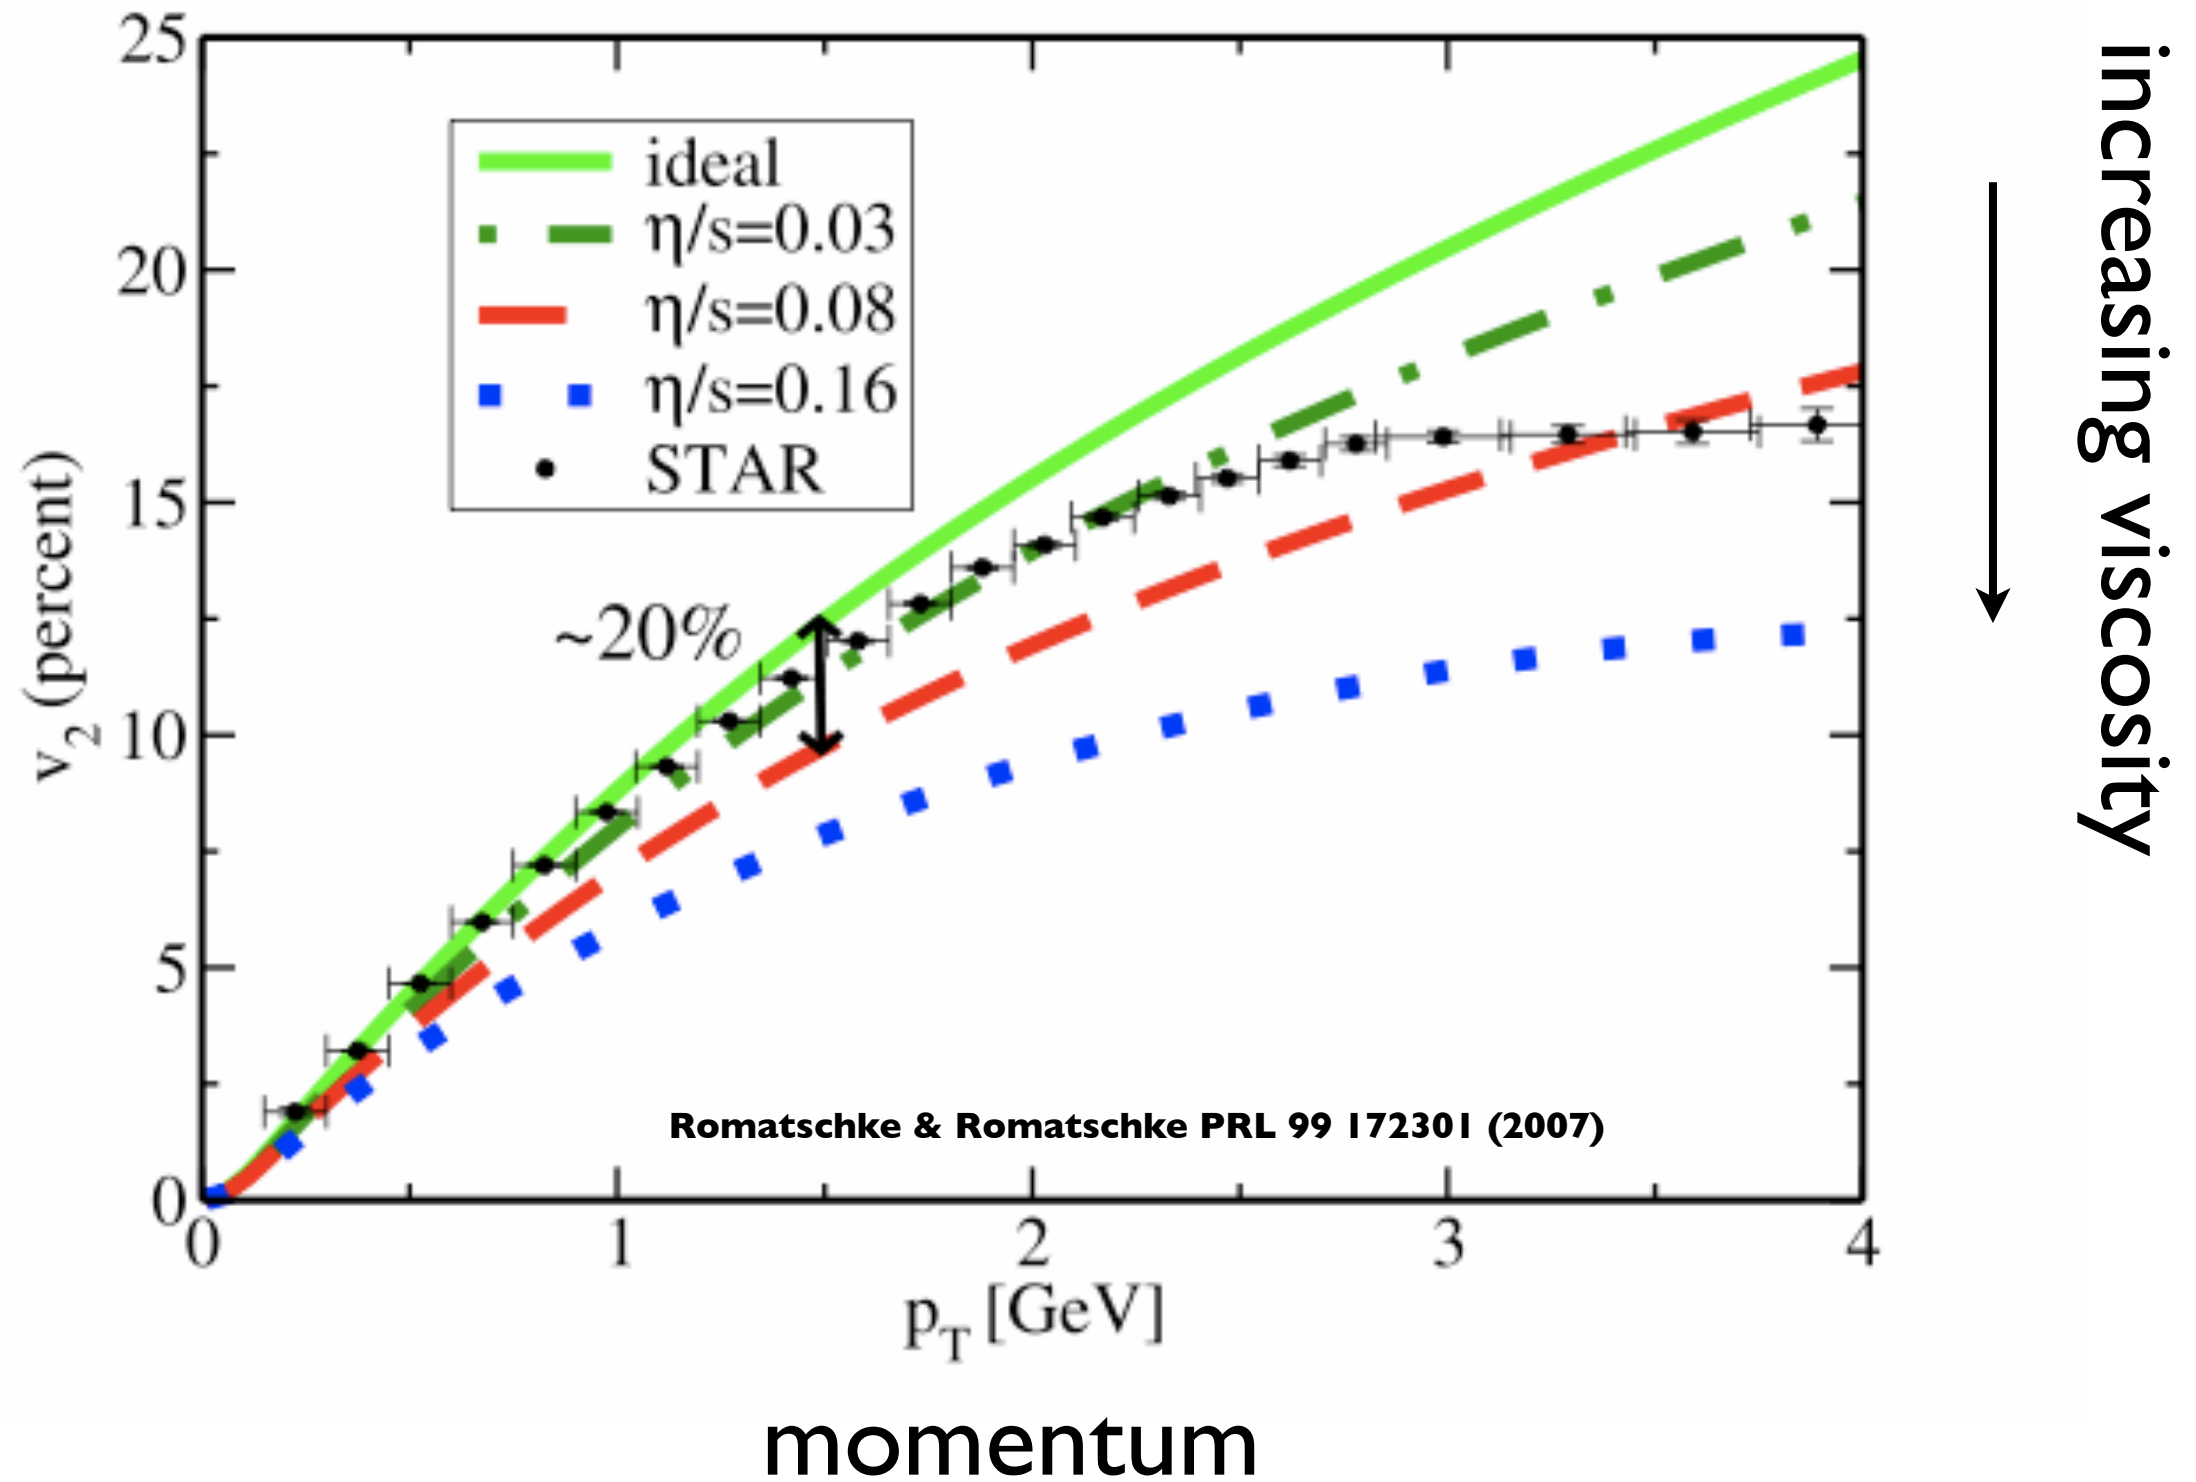

produce and study hot QCD matter!

# idealized picture

- if angle of particles w/ respect to reaction plane is measured:  
$$\frac{dN}{d(\Psi - \phi)} \propto 1 + 2v_2 \cos(\Psi - \phi) + \dots$$
- characterize matter in terms of  $v_2$

# hydrodynamic

# perfect fluid?

---

conjectured  
lower bound!

QGP!

- QGP seems to be in the vicinity of conjectured quantum lower bound for  $\eta/s$
- conjecture based on calculation done on 10 dimensional black holes!
- based on the insight from string theory of the duality between 4 dimensional strongly coupled gauge theories and higher dimensional gravity theories (Maldacena Adv. Theor. Math. Phys. 2, 231, 1998)

# perfect fluid?

conjectured  
lower bound!

QGP!

- QGP seems to be in the vicinity of conjectured quantum lower bound for  $\eta/s$
- conjecture based on calculation done on 10 dimensional black holes!
- based on the insight from string theory of the duality between 4 dimensional strongly coupled gauge theories and higher dimensional gravity theories (Maldacena Adv. Theor. Math. Phys. 2, 231, 1998)

# microscopic nature

---

**parton<sub>i</sub>(E)**

# microscopic nature

peripheral collision

$b$  large

$N_{\text{part}}$  small

$N_{\text{coll}}$  small

# calculable & measurable!

# Testing Expectations

- QCD processes can produce photons:

Compton  
Scattering

Annihilation

- Photons escape the colored final state without interacting
- If the initial state in heavy ion collisions is like a collection of p+p collisions, photon spectra should scale from p+p

# $\gamma$ : control measurement

$$R_{AA} = \frac{\text{yield}_{AA}}{\text{yield}_{pp} * N_{\text{coll}}}$$

$$R_{AA} = 1$$

no nuclear effects

$\gamma$ : no color charge  $\rightarrow$  insensitive to produced matter  
 $R_{AA}(p_T < 14 \text{ GeV/c})$  consistent with unity

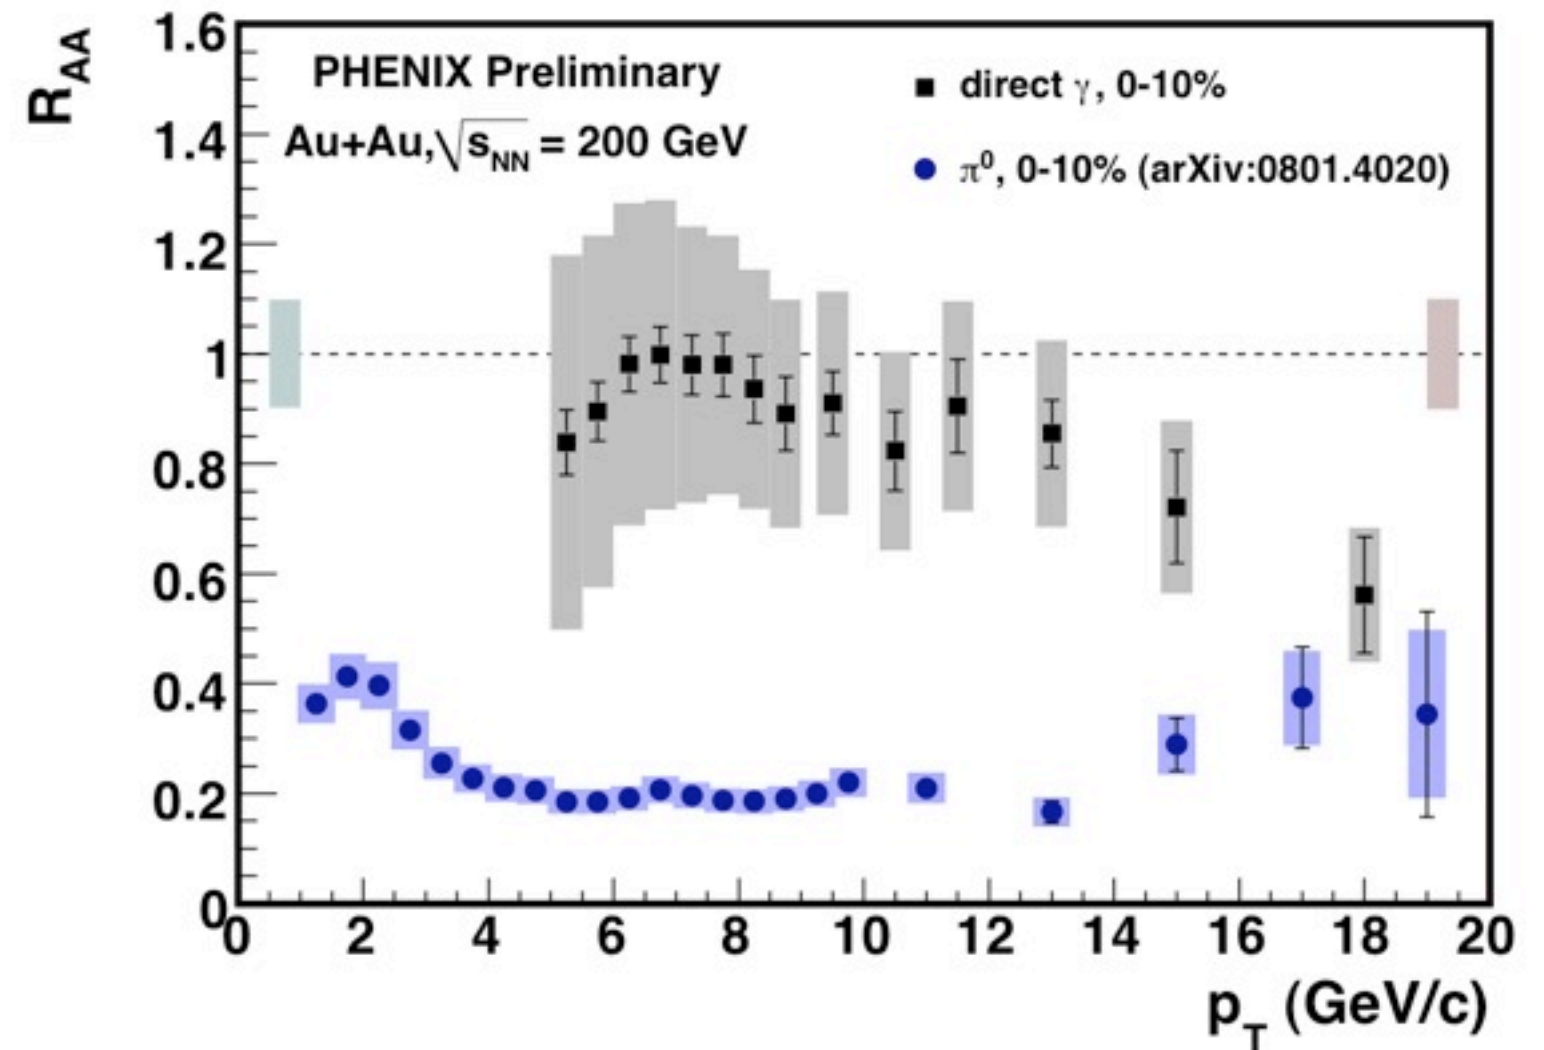

$\pi^0$  from u & d quarks and gluons traversing matter

$$R_{AA} = \frac{\text{yield}_{AA}}{\text{yield}_{pp} * N_{\text{coll}}}$$

$$R_{AA} \ll 1$$

effects of QGP

# what happens to the energy?

gluon  
radiation

collisional  
broadening

- is the energy thermalized in the end?

# what about heavy quarks?

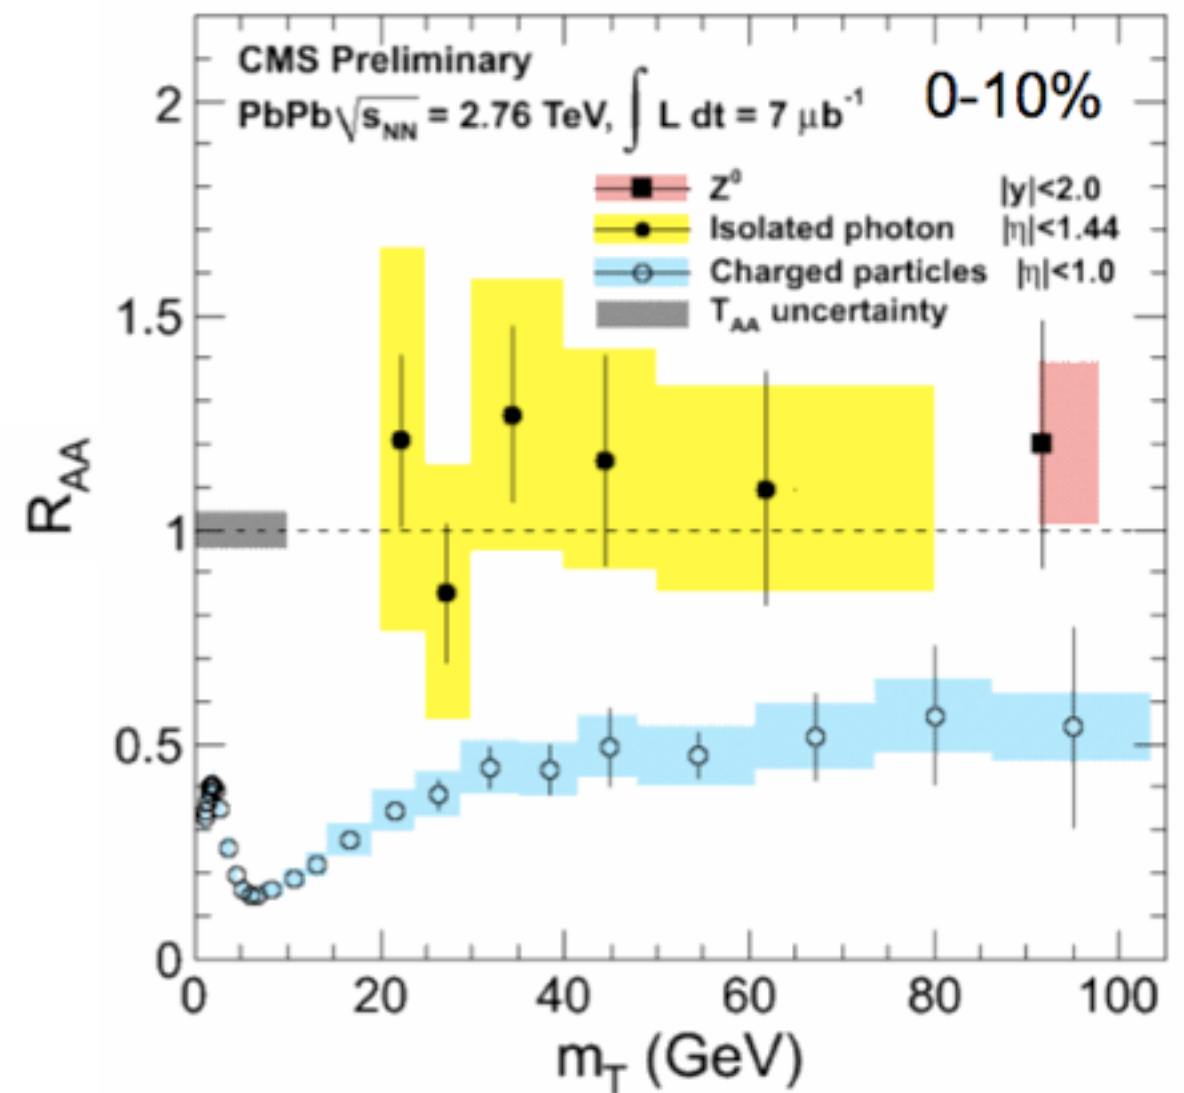

- massive quarks expected to have suppressed gluon radiation

	Charge	Mass
down	-1/3	0.006
up	+2/3	0.003
strange	-1/3	0.1
charm	+2/3	1.2
bottom	-1/3	4
top	+2/3	171

# LHC!

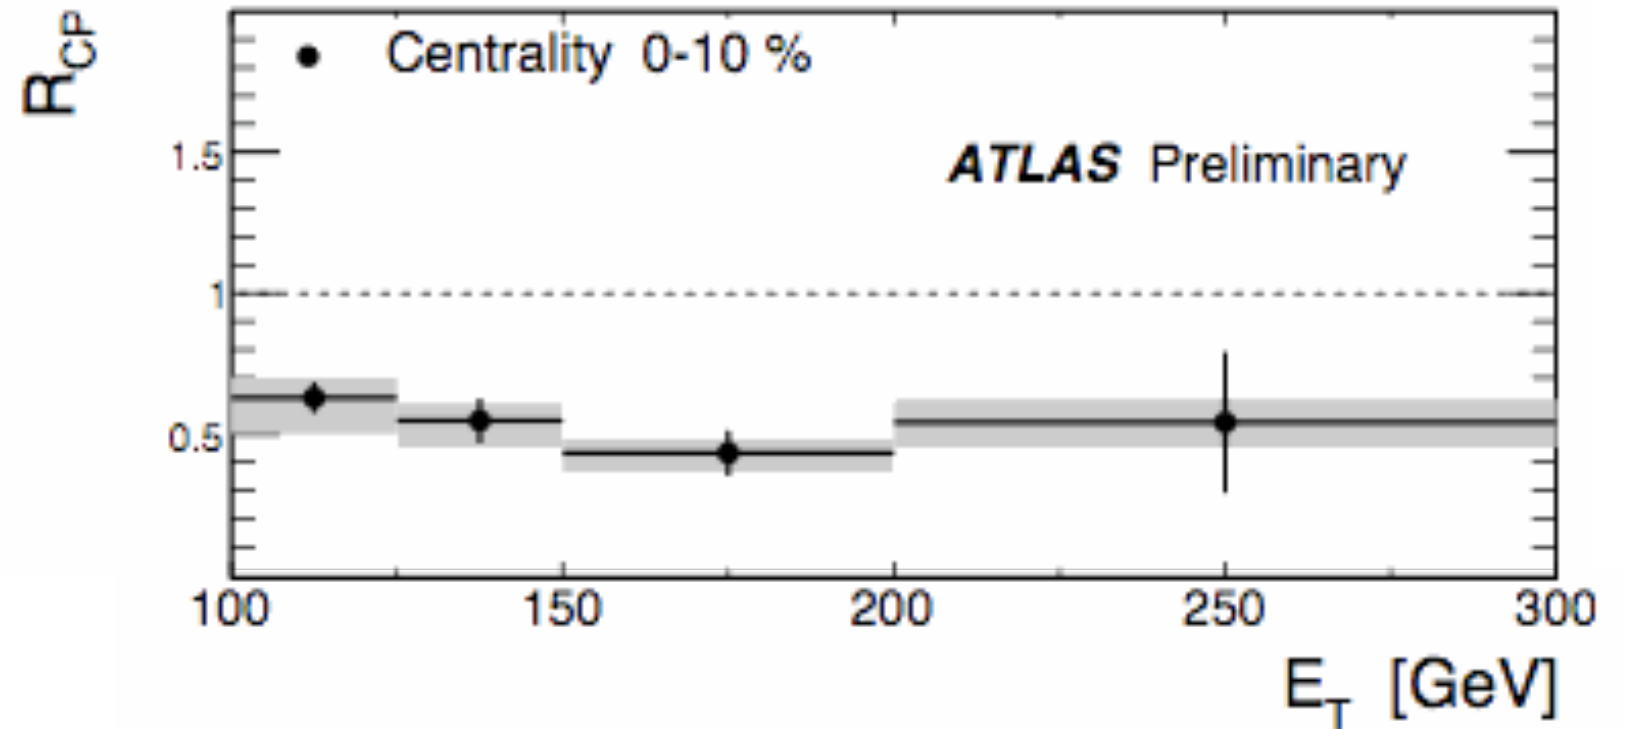

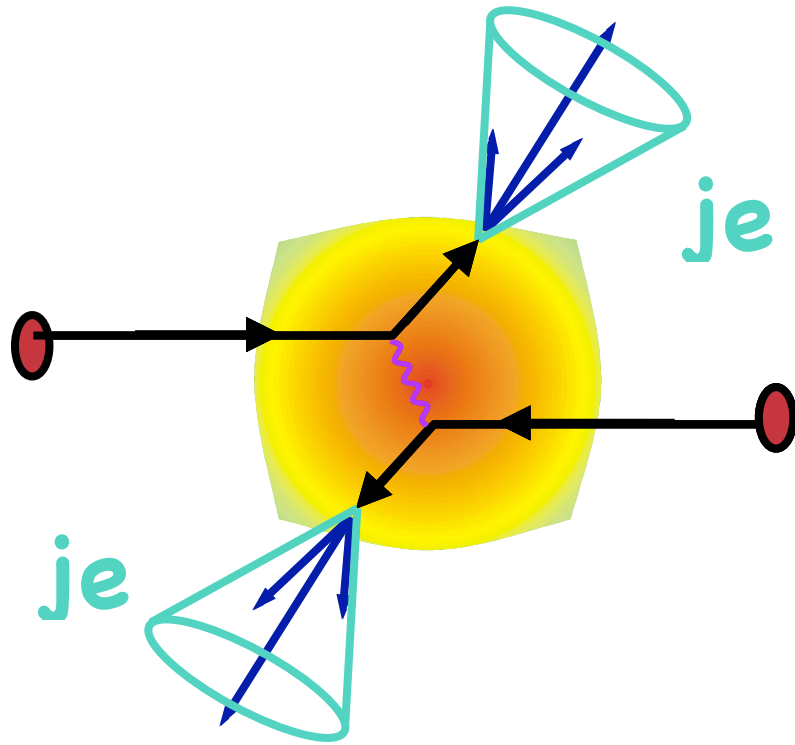

# jets: collecting more energy

---

- even when as much energy as possible within a cone is associated with a jet, jets are still missing!
- energy must end up far from the jet or thermalized

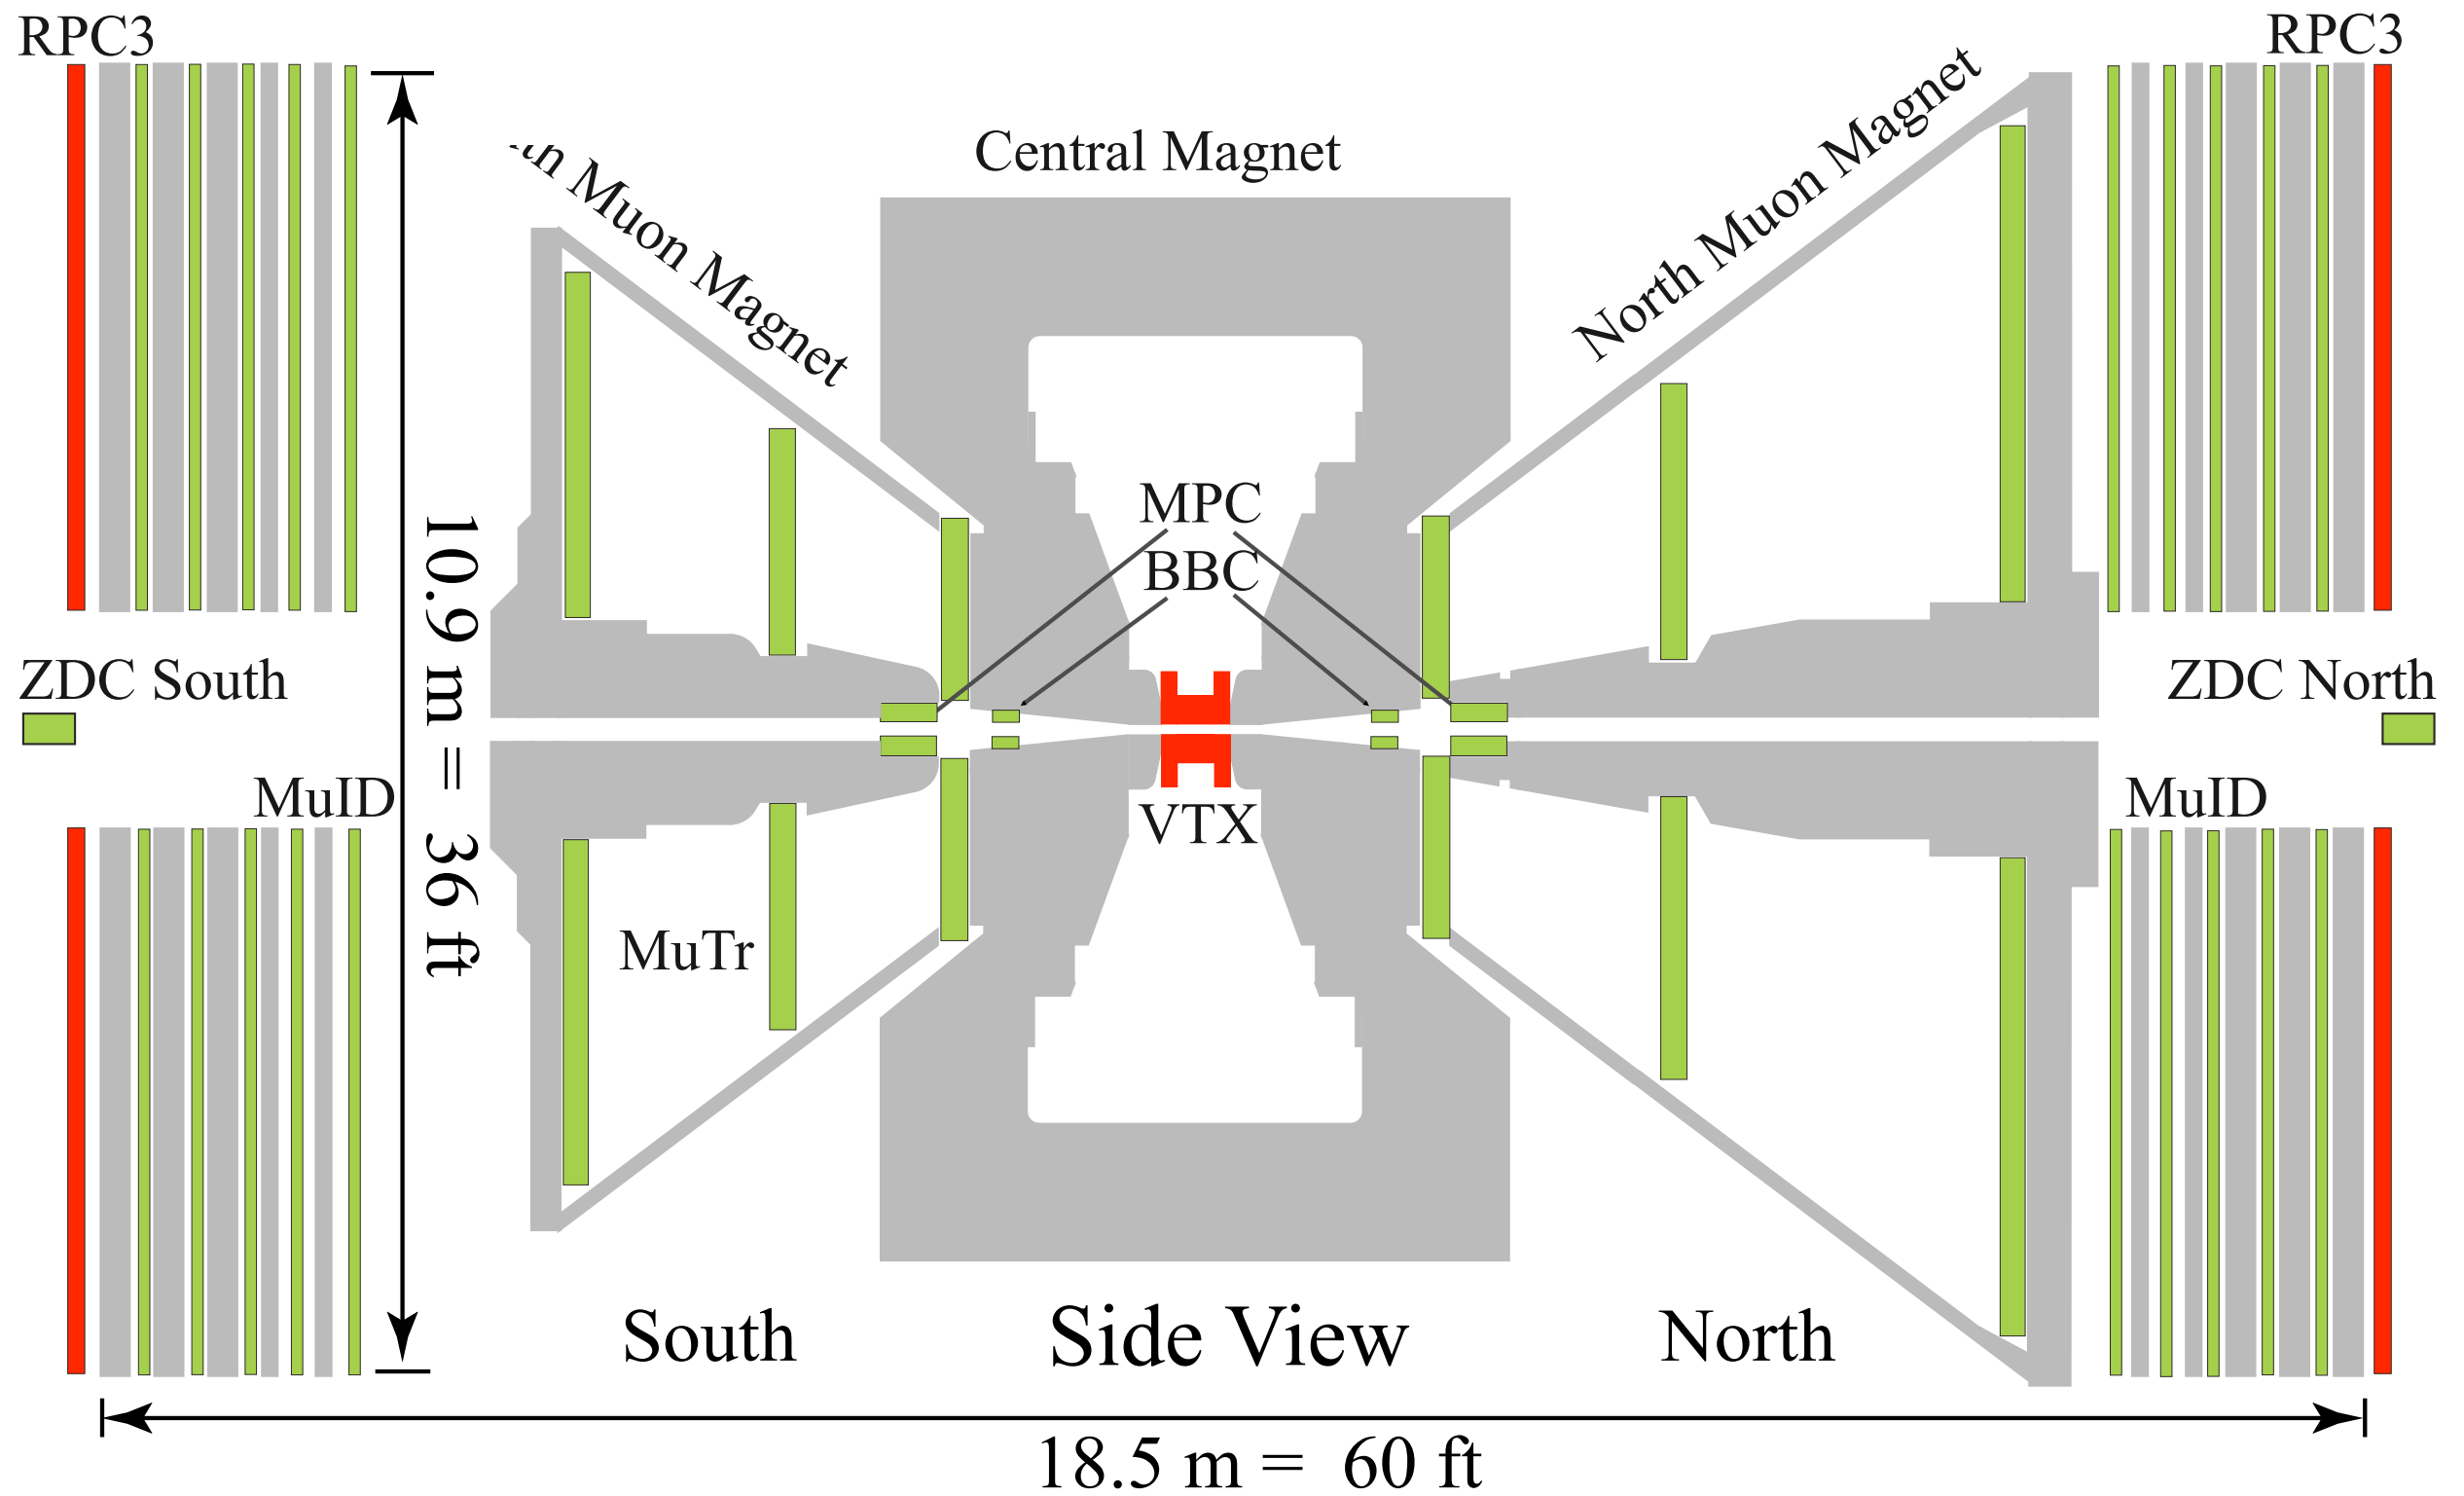

# jets: collecting more energy

- even when as much energy as possible within a cone is associated with a jet, jets are still missing!
- energy must end up far from the jet or thermalized

- complicated questions  $\rightarrow$  precision measurements
- we know we made it, now study of the matter
  - near perfect fluid nature was a surprise, now pinning down  $\eta/s$  of fundamental interest
  - parton matter interactions remain a mystery
  - screening lengths  $\rightarrow$   $J/\psi$ ,  $\Upsilon$  states
  - are there quasiparticles?
  - ....
- complicated questions  $\rightarrow$  creative minds

# PHENIX $\rightarrow$ sPHENIX

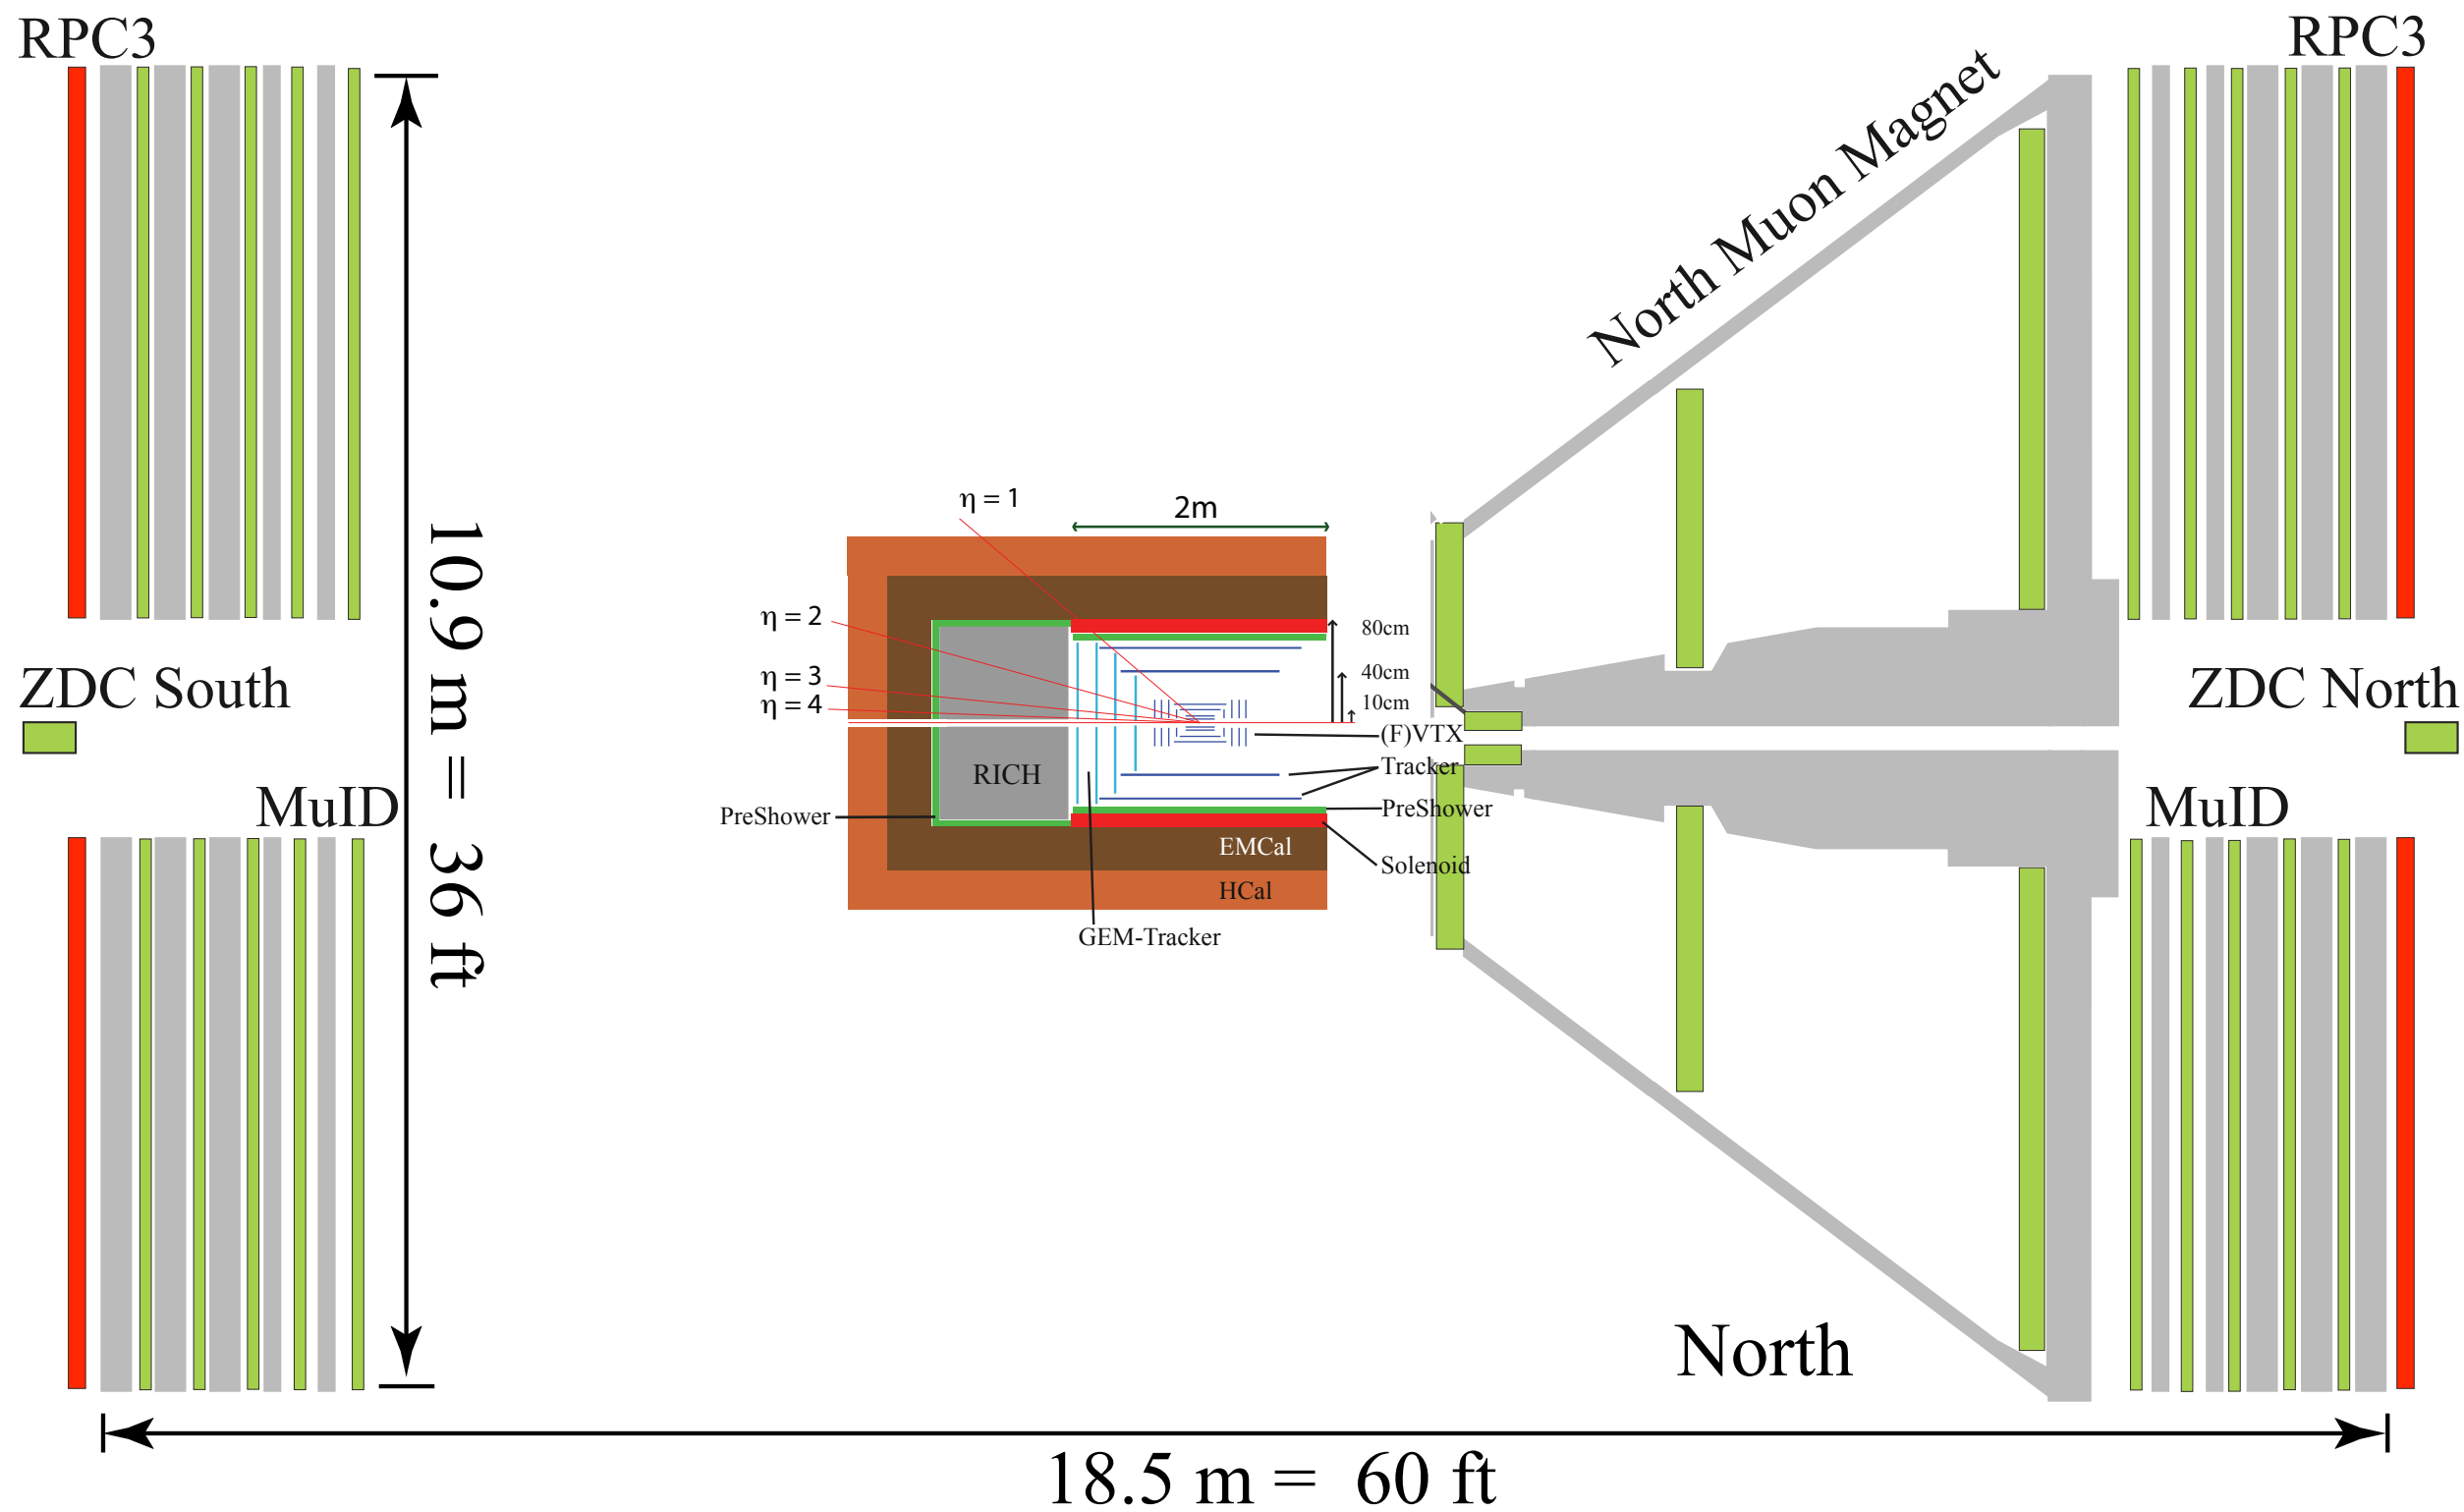

# PHENIX → sPHENIX

# PHENIX $\rightarrow$ sPHENIX

# sPHENIX plan

- maintain PHENIX high rate capability
- record lots of heavy ion data without rare triggers
- retain current (future) silicon vertex detectors (VTX, FVTX)
- large uniform acceptance
- hadronic calorimetry at midrapidity
  - first at RHIC
  - provides the jet resolution & efficiency to extend to high  $p_T$
- forward detectors for useful for spin, asymmetric collisions & e-p/e-A, A-A

# Counting Particles

up to  $\sim 5000$  charged particles  
produced in collisions

U. Heinz
