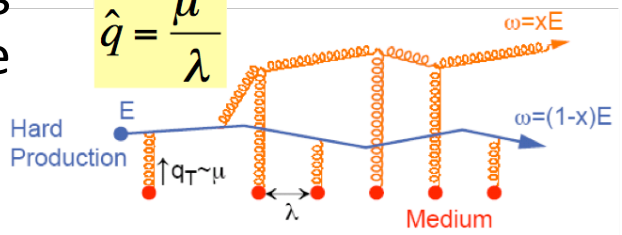
Do We Understand Jet Quenching at RHIC/LHC?

Energy loss of partons from hard scattering through re-scattering in the hot & dense medium

- nuclear modification factor $R_{AA} << 1$ at high p_T

$$\hat{q} = \frac{\mu^2}{\lambda}$$

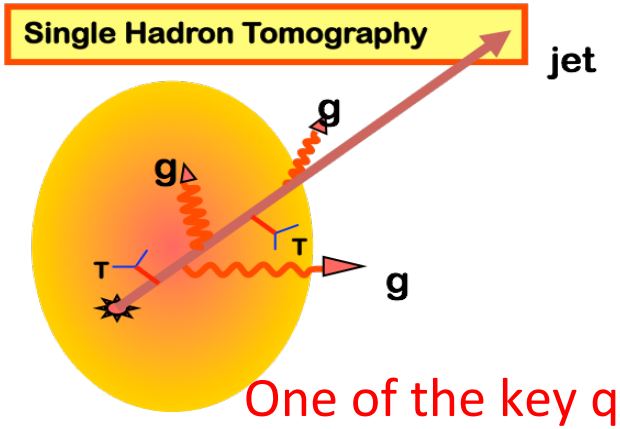


$$R_{AA} = \frac{\text{Yield}_{AA} / \langle N_{\text{binary}} \rangle_{AA}}{\text{Yield}_{pp}} \sim 1 - \int \rho \otimes \frac{dE}{dx}$$

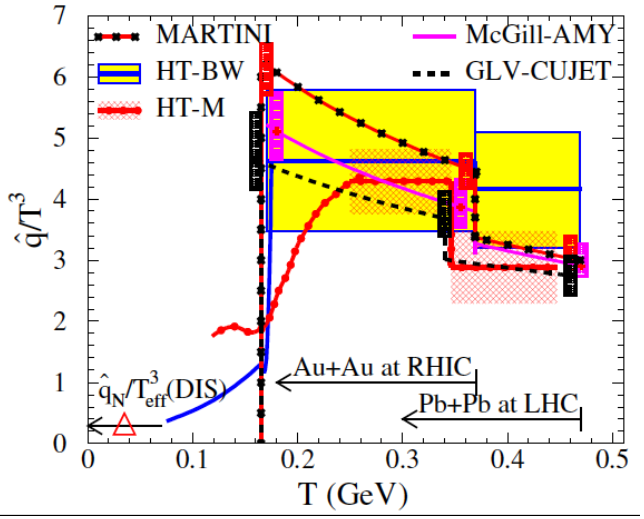
Access medium properties through statistical analysis:

-example: transport coefficient

-model dependent



One of the key questions in heavy ion today

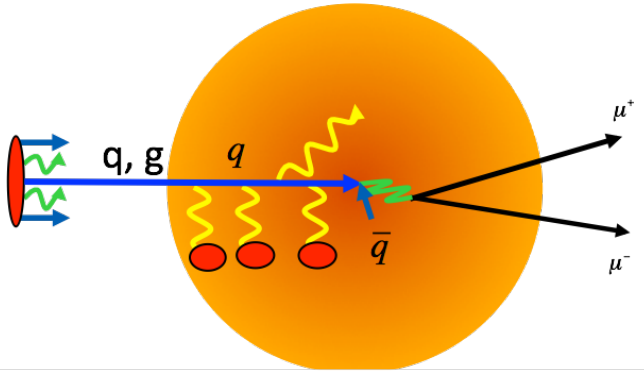


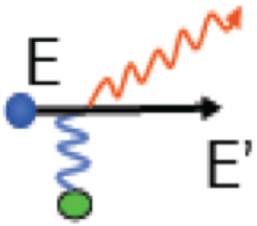
Recent JET collaboration progress (PRC 90, 014909 (2014)) for 10GeV quark:
qhat = 1.2 ± 0.3 GeV^2/fm (RHIC); 1.9 ± 0.7 GeV^2/fm (LHC)

Initial-state Energy Loss and Drell-Yan in p+A

Benchmark quark energy loss models

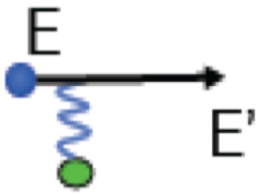
- Minimal final-state interactions
- Know nuclear matter



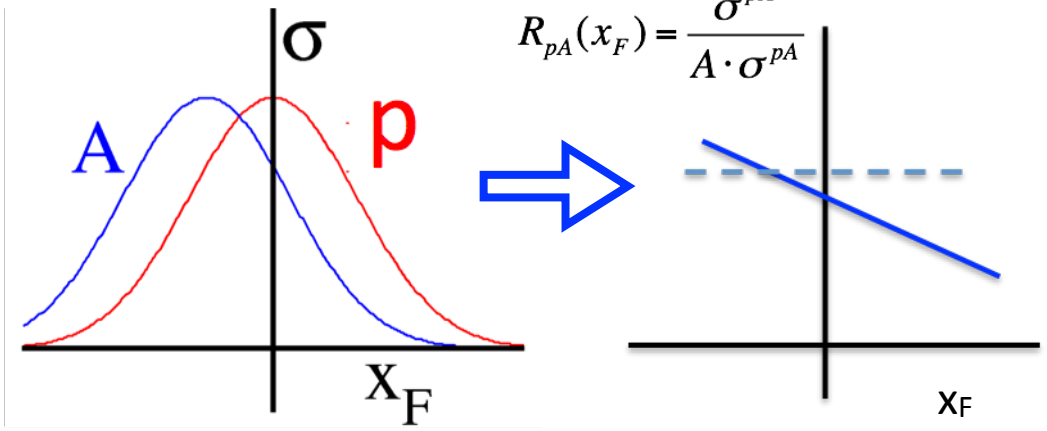


$$\frac{d^2\sigma}{dx_1 dx_2} = \frac{4\pi\alpha^2}{9x_1x_2}\frac{1}{s} \times \sum_i e_i^2 \left[q_{ti}(x_t)\bar{q}_{bi}(x_b) + \bar{q}_{ti}(x_t)q_{bi}(x_b)\right]$$

Radiative dE/dx



Collisional dE/dx



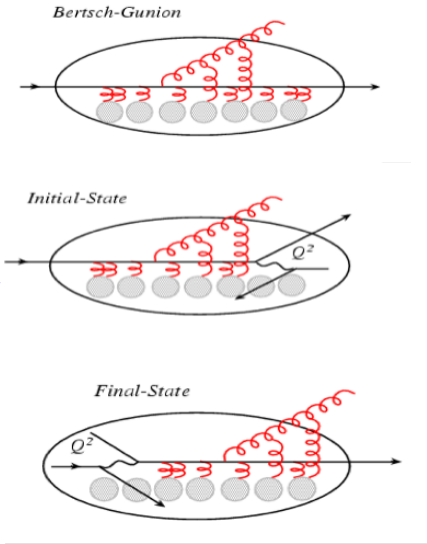
The Expectations

Think of the parton (quark) energy loss in the nuclear rest frame

Ideal QGP

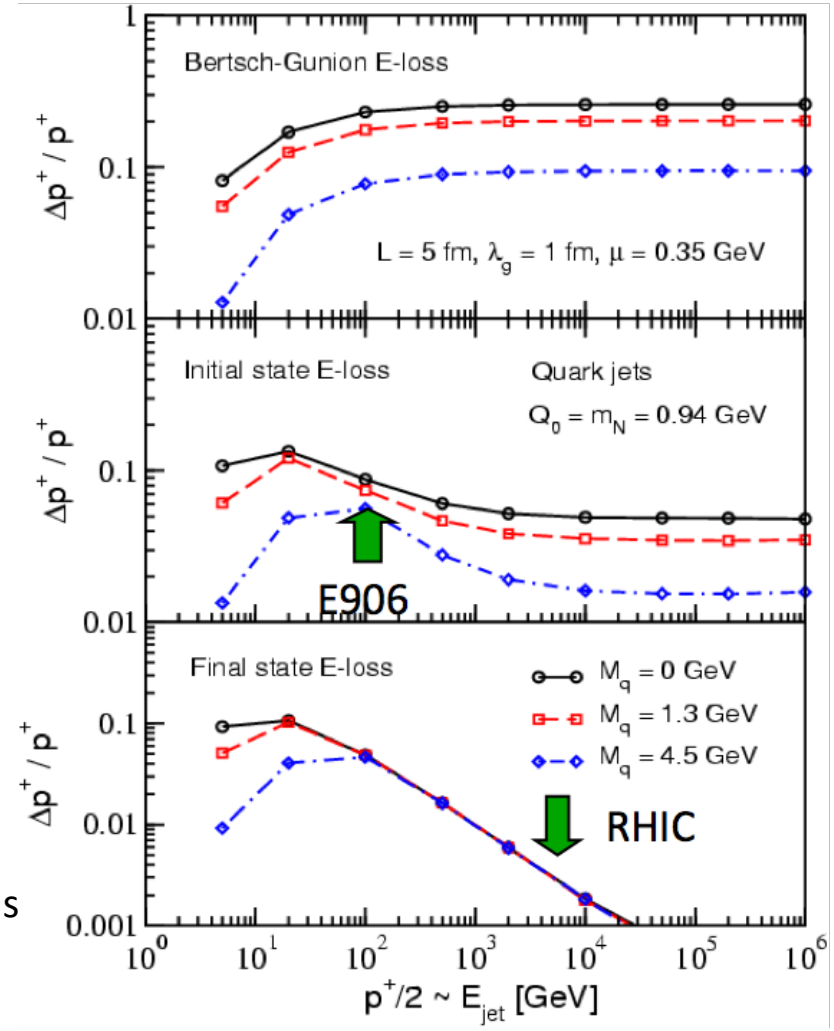
Drell-Yan: p+A

DIS:e+A



- Initial-state E-loss is large and much larger than final-state energy loss for cold nuclei
- In Drell-Yan we don't have final-state interactions

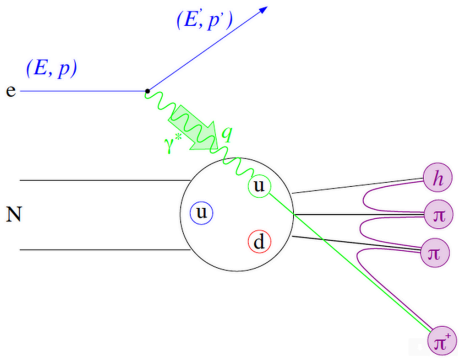
I. Vitev PRC 75, 064906 (2007)



Parton Energy Loss in SIDIS

- Out going quarks
- HERMES A-dependent fragmentation functions
- Must understand nuclear-dependent fragmentation
- Wang & Wang
  - Assume all from quark energy loss:

dE/dx = 0.5 GeV/fm @ E = 10 GeV for Au.



Wang & Wang PRL 89 162301 (2002)

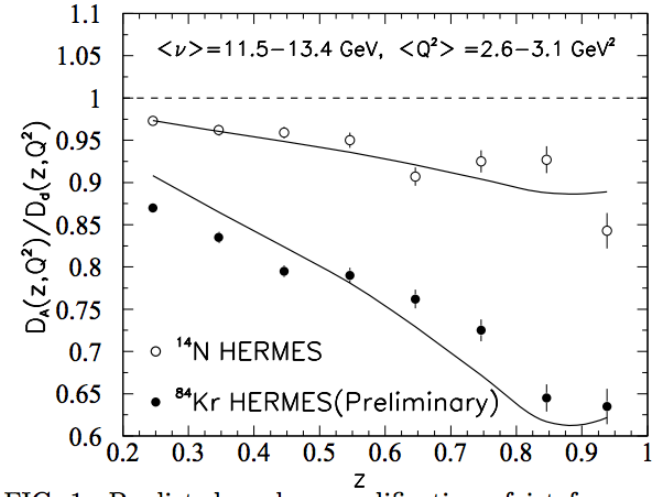


FIG. 1. Predicted nuclear modification of jet fragmentation function is compared to the HERMES data [10] on ratios of hadron distributions between A and D targets in DIS.

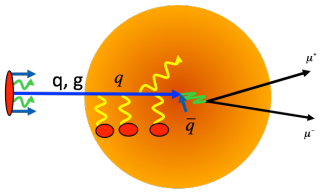
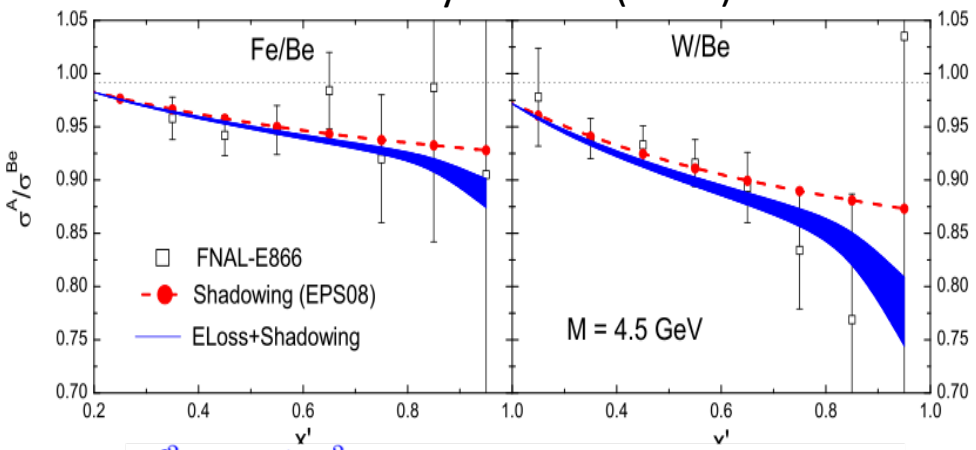
Early Data from E866 @ Fermilab



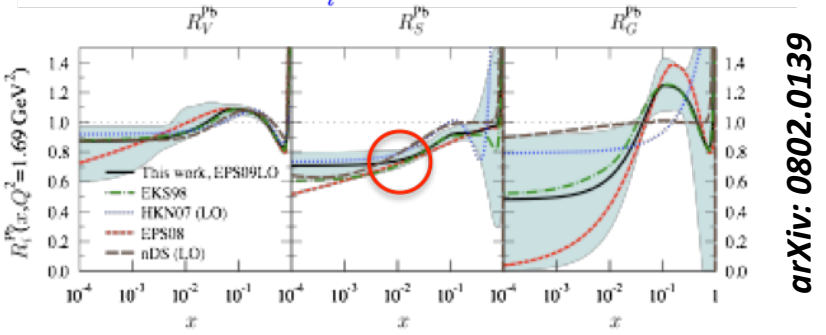
- Energy loss vs. shadowing
- Correction must be made for shadowing effects
  - Garvey & Peng PRL 90 (2003)
- NO partonic energy loss if all effects from shadowing
  - Vasiliev *et al.*, PRL 83 (1999)
- Significant parton energy loss, ~1.2 GeV/fm if all from energy loss
  - Johnson *et al.*, PRC 65 025203 (2002)

Both yield 20~30% effects in R_{pA}

Nucl. Phys. A 879 (2012)



$$\frac{d^2\sigma}{dx_1 dx_2} = \frac{4\pi\alpha^2}{9x_1x_2}\frac{1}{s} \times \sum_i e_i^2 \left[q_{ti}(x_t)\bar{q}_{bi}(x_b) + \bar{q}_{ti}(x_t)q_{bi}(x_b)\right]$$



arXiv: 0802.0139

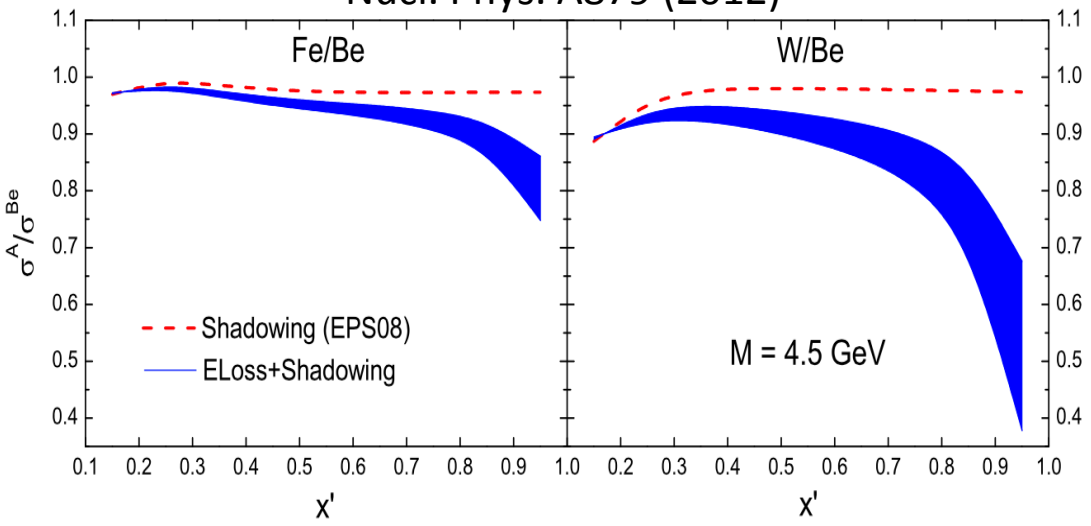
Figure 11: Comparison of the average valence and sea quark, and gluon modifications at $Q^2 = 1.69\,\mathrm{GeV}^2$ for Pb nucleus from LO global DGLAP analyses EKS98 [1, 2], EKPS [3], nDS [6], HKN07 [5], and this work EPS09LO.

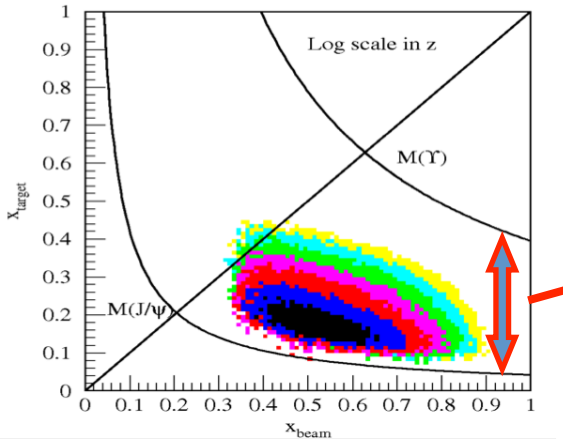
E906 Drell-Yan Dimuon Acceptance

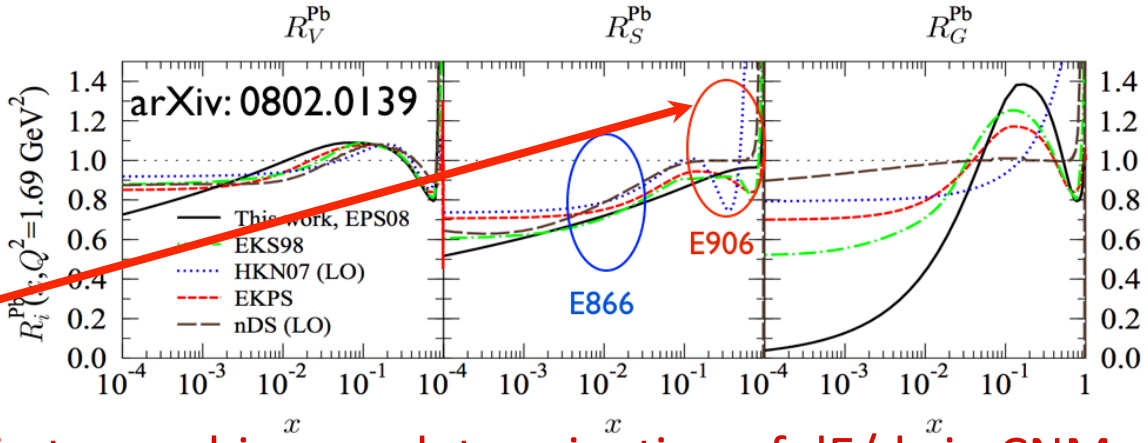
- Parton initial energy: 30 - 120 GeV (relevant to RHIC and LHC parton energy)
- Direct test on various models:
  - Gavin and Milana: $\Delta x_1 = -\kappa_1 x_1 A^{\frac{1}{3}}$
  - Brodsky and Hoyer: $\Delta x_1 = -\frac{\kappa_2}{s} A^{\frac{1}{3}}$
  - Baier *et al*: $\Delta x_1 = -\frac{\kappa_3}{s} A^{\frac{2}{3}}$

- Sea quark x = 0.1 ~ 0.3
- Minimal shadowing
- *1/s* enhanced dE/dx effect

Nucl. Phys. A879 (2012)

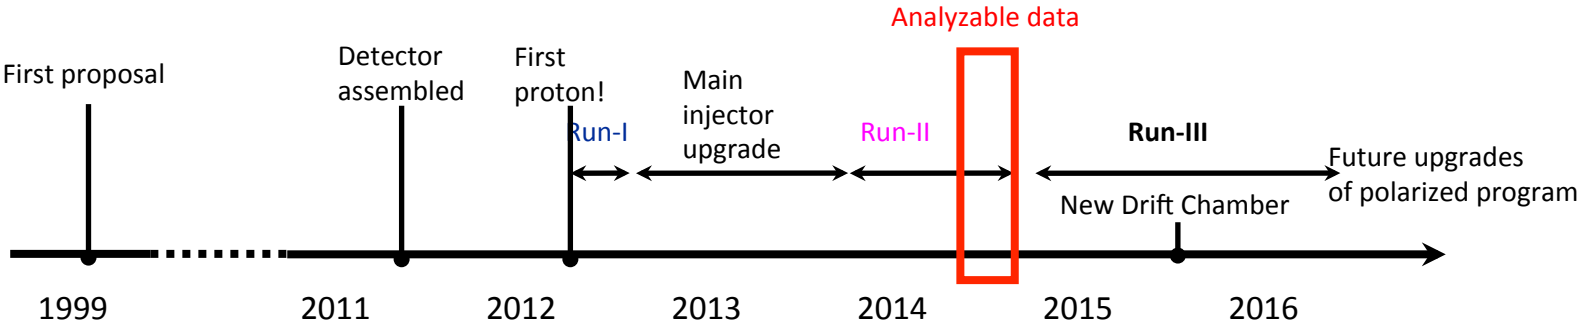




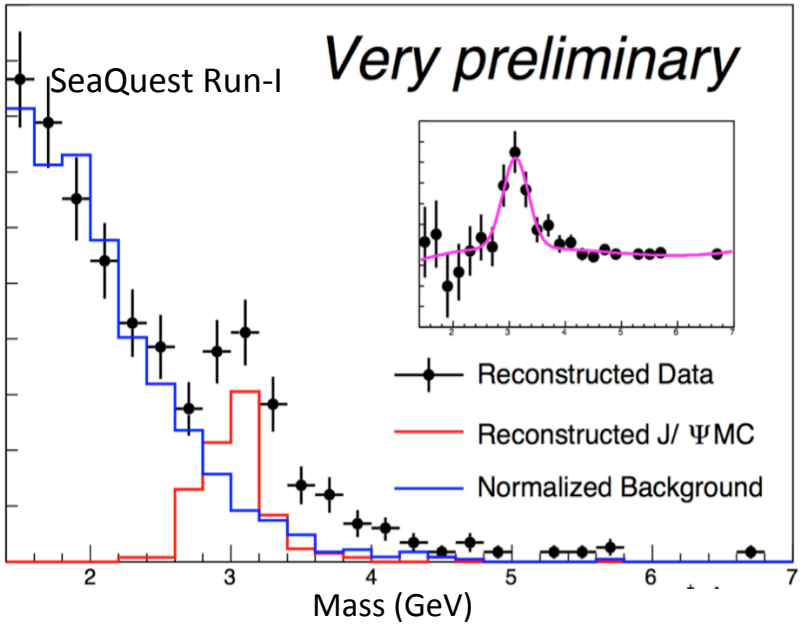


First unambiguous determination of dE/dx in CNM

Timeline and milestones of SeaQuest

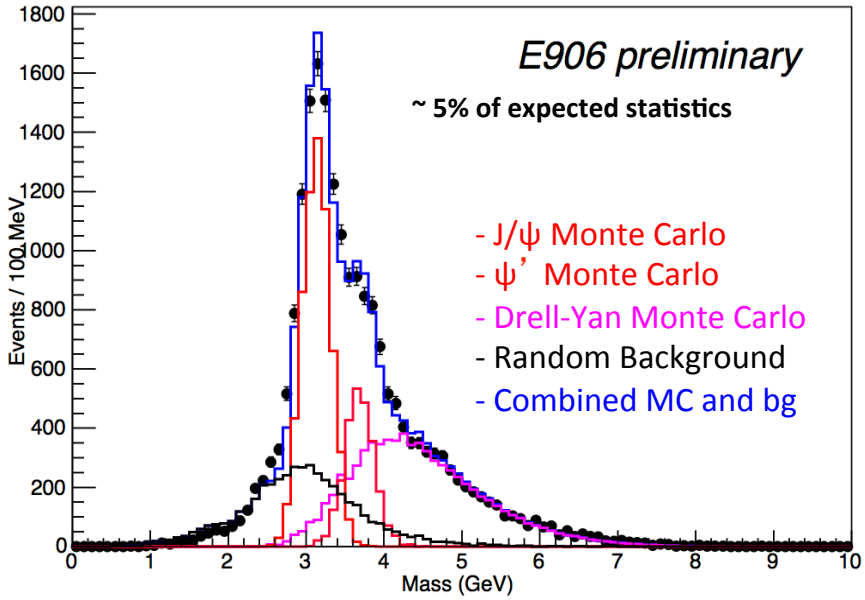


- Due to various delays, only a very short 2-month commissioning Run-I was taken in early 2012
- In the longer Run-II, we solved almost all the problems discovered in Run-I
- After a short 2-month accelerator maintenance, we started a 2-yr Run-III
- New station-1 drift chamber will be installed soon to extend the x_2 coverage
- Polarized projects (target and/or beam) will take over in summer 2016



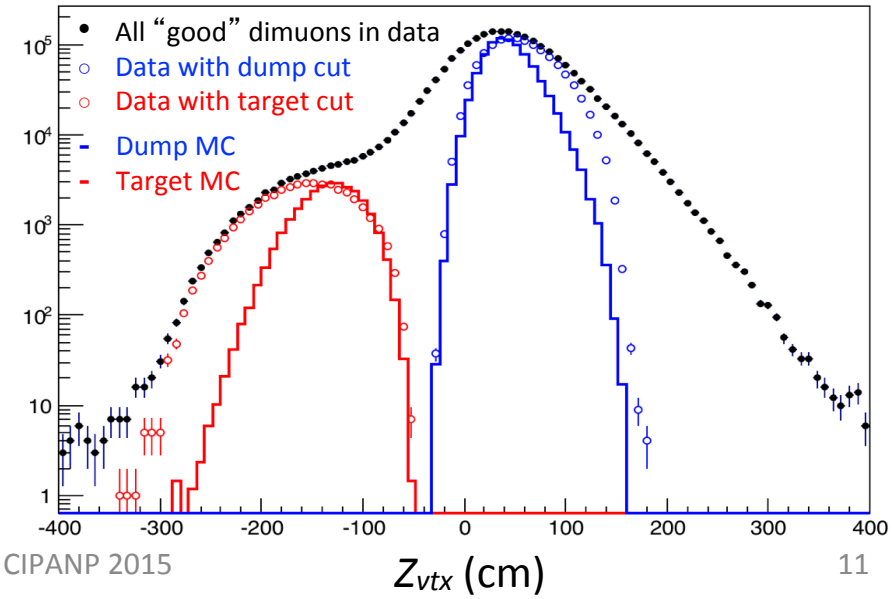
Dr. Markus Diefenthaler, Polarized Drell-Yan measurement at Fermilab: The future of the SeaQuest experiment, WG7, Apr. 30

Data from Run 2014 (Run-II)



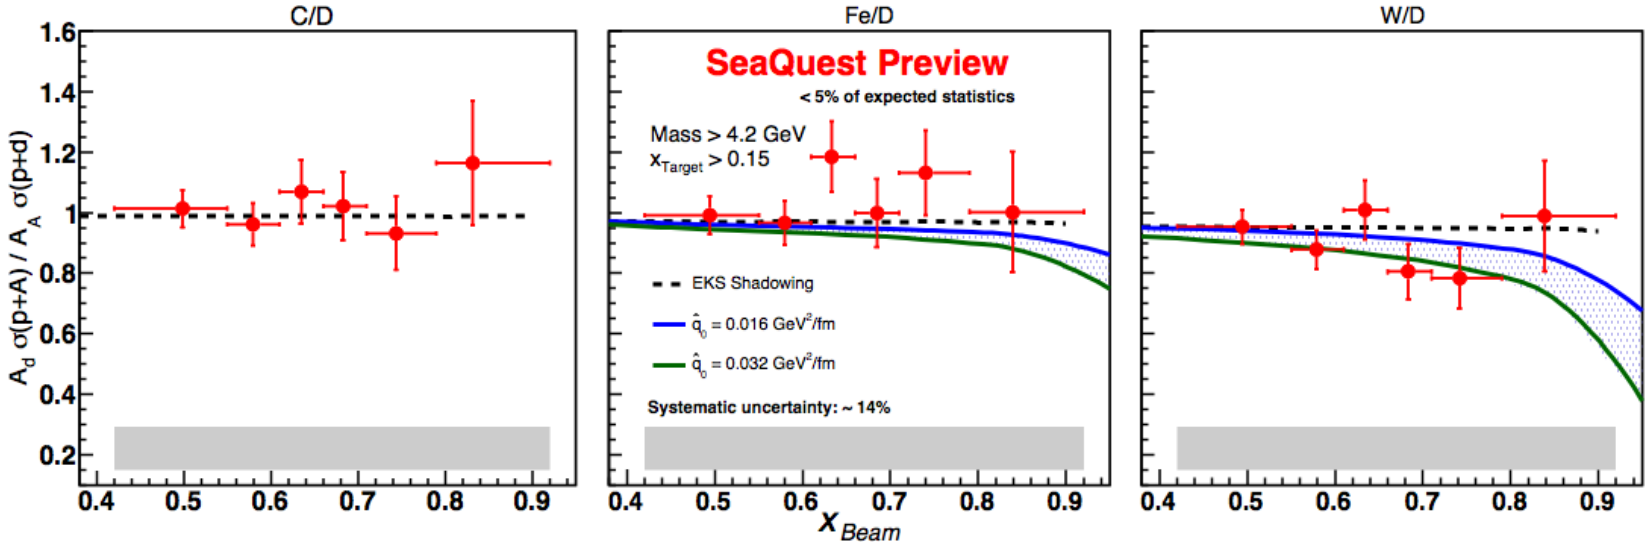
- Monte Carlo describe data well
- Resolution better than expected
  - $\sigma_M(J/\psi) \sim 180$ MeV, $\sigma_M(DY) \sim 220$ MeV
  - J/ψ ψ' separation
  - Cleaner DY sample
- Good target/beam dump separation

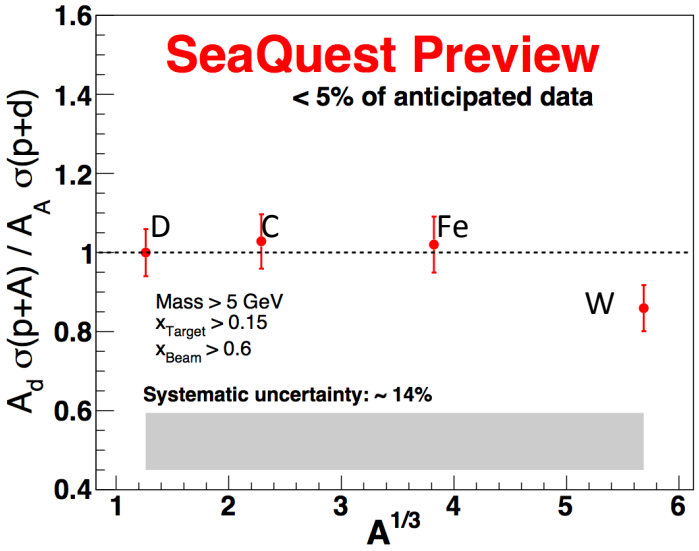
- Beam quality worse than expected (instantaneous rate much higher than average)
  - live time of spectrometer greatly reduced by the 'super' RF buckets
  - Reconstruction efficiency lower than expected because of the high detector occupancy



- Entire beam interacts upstream of SeaQuest spectrometer
- Pointing resolution very poor along beam axis
- Dominated by random coincidences

First Quark Energy Loss Study at E906





- Too early to make any conclusion on p+Fe as limited by the statistics
- A consistently negative slope beyond the shadowing strength is observed in p+W data.
- With 20x more statistics, we will be able to clearly distinguish between:
  - ➢ $-dE \propto A^{1/3}$ (or $\propto L$)
  - ➢ $-dE \propto A^{2/3}$ (or $\propto L^2$)

Summary

Run-II: 5% of total statistics:

- observed a negative slope 2σ beyond the extent of shadowing

Ongoing Run-III: ~20x of Run-II statistics

Other ongoing physics analysis:

- EMC effect in Drell-Yan
- Transverse momentum broadening
- Difference between J/ψ and ψ' suppression in pA
- Search for double J/ψ production
- Search for dark photons
- …
